Empathize & Discover – Empathy Map Canvas

Date	8 September 2026
Team ID	Individual Project
Project Name	Automated Network Request Management in ServiceNow
Maximum Marks	4 Marks

Purpose of the Empathy Map

This empathy map identifies the behaviours, attitudes, goals and challenges of the main users involved in the Automated Network Request Management process. Understanding these perspectives helps ensure that the ServiceNow solution addresses real user problems rather than only technical requirements.

Primary Persona: Network Requester

Persona: An employee or authorized user who needs network access, VPN access, a firewall change, a network configuration change or assistance with a network-related service.

THINK & FEEL • Wants the request to be simple and quick. • Worries about delays affecting work. • Needs confidence that sensitive access is handled securely. • Wants clear information about request progress.	NETWORK REQUESTER <i>Needs a fast, standardized and transparent way to request network services.</i>	HEAR • Instructions from managers and IT teams. • Feedback that approvals may take time. • Security and compliance requirements. • Updates from colleagues about similar requests.
SAY & DO • Selects the required network request type. • Provides device details and business justification. • Submits the request through the Service Catalog. • Checks status and follows up when needed.		SEE • Different network services with different requirements. • Request forms and approval stages. • Status updates such as New or In Progress. • Notifications about approval or completion.

PAIN

- Manual or confusing request processes.
- Repeated requests for missing information.
- Delayed approvals and fulfilment.
- Limited visibility into request status.
- Uncertainty about when access will be provided.

GAIN

- Easy-to-use standardized request form.
- Relevant fields displayed dynamically.
- Faster routing and fulfilment.
- Real-time status visibility.
- Notifications at important stages.

Secondary Persona: Network Engineer / Approver

Persona: A member of the Network Team or an authorized approver responsible for reviewing requests, making approval decisions, processing fulfilment tasks and maintaining network security and compliance.

THINK & FEEL • Wants complete and accurate request information. • Needs to maintain security and compliance. • Wants to avoid repetitive manual work. • Needs visibility into workload and priorities.	NETWORK ENGINEER / APPROVER <i>Needs an efficient, secure and well-organized workflow for approval and fulfilment.</i>	HEAR • Urgent requests from business users. • Security policies and management requirements. • Escalations related to delayed requests. • Notifications requiring approval or action.
SAY & DO • Reviews request details and justification. • Approves or rejects eligible requests. • Updates task states and work notes. • Completes network configuration or access changes.		SEE • Requests with different access levels and priorities. • Pending approvals and assigned tasks. • SLA deadlines and workload queues. • Reports showing task performance.
PAIN • Incomplete or inconsistent requests. • Manual approval routing and task assignment. • Difficulty tracking work across requests. • Repeated follow-up communication. • Risk of missing SLA targets.	GAIN • Standardized request information. • Automated approval and task workflows. • Clear task ownership and priorities. • Work notes and status tracking. • Reports and dashboards for monitoring.	

Key Insights for the Project

- Users need a centralized and standardized process instead of manual and inconsistent request handling.
- Requesters value simplicity, transparency and timely status updates.
- Approvers and network engineers need complete information, automated routing and controlled access.
- Dynamic fields and validation can reduce incomplete or incorrect requests.
- Automated approvals, fulfilment tasks and notifications can reduce delays and manual effort.
- Reports and SLA tracking are important for visibility, accountability and continuous improvement.

Conclusion: The empathy analysis shows that both requesters and the Network Team benefit from a standardized, automated and transparent ServiceNow workflow. These user insights directly support the design of the Network Request catalog item, approval process, fulfilment tasks, notifications, access controls and dashboards.
