

Ideation Phase

Define the Problem Statements

Date	8 September 2026
Team ID	Individual Project
Project Name	Automated Network Request Management in ServiceNow
Maximum Marks	2 Marks

Customer Problem Statement

The problem statement is defined from the perspective of the people who interact with network-related service requests. Following the template structure, each statement identifies the customer, the goal they are trying to achieve, the barriers they face, why those barriers exist, and the resulting impact.

Project Context: The Automated Network Request Management in ServiceNow project aims to improve the way network service requests are submitted, validated, approved, fulfilled and tracked. The key stakeholders include requesters, approvers and network engineers.

Problem Statement PS-1: Network Requester

Problem Statement (PS)	I am	I'm trying to	But	Because	Which makes me feel
PS-1	An employee or authorized network requester	Request network access, VPN access, firewall changes or other network services quickly and correctly	The existing request process can be manual, unclear and inconsistent, requiring repeated communication and follow-up	There may be no standardized request form, complete validation or clear visibility into the request lifecycle	Frustrated and uncertain about when the request will be completed

PS-1 Summary:

A requester needs a simple and standardized way to submit network-related requests and track their progress. The proposed ServiceNow solution addresses this by providing a Network Request catalog item with relevant fields, dynamic field visibility, validation, automated status updates and requester notifications.

Problem Statement PS-2: Approver and Network Team

Problem Statement (PS)	I am	I'm trying to	But	Because	Which makes me feel
PS-2	A network approver or network engineer	Review, approve and fulfil legitimate network requests efficiently while maintaining security and compliance	Requests may arrive with incomplete information or require manual routing and coordination	Approval rules, task assignment and request tracking may not be automated or standardized	Overloaded, delayed and concerned about errors or missed security requirements

PS-2 Summary:

Approvers and network engineers need an automated and controlled workflow that routes requests based on access type and priority, sends approval notifications, automatically creates fulfilment tasks and assigns them to the appropriate Network Team. The solution also provides work notes, status tracking, access controls and reporting for better visibility.

Identified Core Problem

The core problem is the lack of a centralized, standardized and automated process for managing the complete lifecycle of network service requests. This affects requesters, approvers and network engineers through manual effort, delays, inconsistent information, limited visibility and increased risk of human error.

Proposed Direction

The proposed direction is to implement an end-to-end Automated Network Request Management solution in ServiceNow using a Service Catalog item, client-side validation, dynamic fields, approval automation, fulfilment tasks, notifications, role-based access controls and reporting dashboards.
