Maximum Marks	4 Marks

Brainstorm & Idea Prioritization for the Project

This document applies the uploaded Brainstorm & Idea Prioritization Template to the **Automated Network Request Management in ServiceNow** project. The objective is to identify the main operational problem, generate possible solution ideas, group them into meaningful areas, and prioritize the most valuable features for implementation.

Step 1: Team Gathering, Collaboration and Problem Statement

Project Context: Network-related requests are often handled through manual communication, emails, spreadsheets, or inconsistent processes. This can cause delays, incomplete information, approval bottlenecks, poor visibility, and difficulty tracking fulfilment.

Problem Statement: How can we streamline and automate the end-to-end lifecycle of network-related service requests in ServiceNow so that users can submit standardized requests, the system can validate and route them for approval, network teams can fulfil them efficiently, and stakeholders can track request status and SLA performance in a centralized platform?

Business Objectives:

- Reduce manual effort and human error in processing network requests.
- Accelerate request fulfilment through automated routing and task creation.
- Enforce standardized workflows and approval processes.
- Improve visibility and tracking through a centralized ServiceNow platform.
- Enhance the end-user experience with faster and more reliable service delivery.
- Support compliance with IT and security policies through controlled access and approvals.

Step 2: Brainstorm, Idea Listing and Grouping

The following ideas were generated by analyzing the project requirements and grouping related capabilities.

Idea Group	Brainstormed Ideas
Request Capture	Create a Network Request catalog item; capture request type, access level, device details, priority and business justification.
User Experience	Use Catalog Client Scripts to dynamically show or hide fields based on the selected network request type.
Validation	Validate mandatory information, business justification and request-specific details before submission.
Approval Automation	Route requests for approval based on network access type and priority; support approval and rejection decisions.
Notifications	Send automated email notifications to approvers and requesters at key lifecycle stages.
Fulfilment	Automatically create network fulfilment tasks after approval and assign them to the appropriate Network Team.
Task Processing	Allow network engineers to update task states, add work notes and complete configuration or access changes.
Status Tracking	Automatically update the request lifecycle: New → Awaiting Approval → In Progress → Completed.
Security & Access	Configure Network Team, Approvers and Requesters groups with appropriate roles and access controls.
Reporting & SLA	Track requests, approvals, task performance and SLA compliance through lists, reports and dashboards.

Functional Grouping

- **Core Request Management:** Catalog item, request variables and validation.
- **Workflow Automation:** Approval routing, task creation, assignment and status updates.
- **User & Access Management:** Requesters, Approvers, Network Team groups, roles and ACLs.
- **Communication:** Automated notifications for approval, rejection, progress and completion.
- **Monitoring & Governance:** Lists, reports, dashboards and SLA compliance.

Step 3: Idea Prioritization

Ideas are prioritized using two criteria: **Importance** (business value and necessity) and **Feasibility** (practicality of implementation in a ServiceNow PDI).

Feature / Idea	Importance	Feasibility	Priority
Network Request Catalog Item	High	High	1
Request Variables & Validation	High	High	2
Approval Routing	High	High	3
Automatic Fulfilment Task Creation	High	High	4
User Groups, Roles & Access Controls	High	Medium	5
Dynamic Field Display	High	High	6
Requester & Approver Notifications	Medium	High	7
Automatic Status Tracking	High	Medium	8
Reports & Dashboards	Medium	High	9
SLA Compliance Tracking	Medium	Medium	10

Selected Solution

The prioritized solution is an end-to-end **Automated Network Request Management** workflow in ServiceNow. The solution begins with a standardized catalog request and continues through validation, approval, automated task creation, network-team fulfilment, status updates, notifications and performance tracking.

High-Level Proposed Workflow

1. Requester submits a Network Request through the Service Catalog or Service Portal.
2. The system validates request information and dynamically displays relevant fields.
3. The request is evaluated based on access type and priority.
4. Requests requiring authorization are routed to the appropriate approver.
5. Approvers receive automated notifications and approve or reject the request.
6. After approval, ServiceNow automatically creates fulfilment tasks and assigns them to the Network Team.
7. Network engineers process tasks, update work notes and complete the requested configuration or access change.
8. Request status is updated automatically as work progresses.
9. Requesters receive notifications at key stages.
10. Administrators and developers monitor requests, approvals, tasks and SLA performance through reports and dashboards.

Conclusion: The ideation and prioritization process identifies automation, standardization, approval control and visibility as the highest-value capabilities. These prioritized requirements provide a clear foundation for the subsequent phases of backend configuration, UI/UX customization, testing, security and final reporting.
