

Project Design Phase

Solution Architecture

Date	16 September 2026
Team ID	Individual Project
Project Name	Network Request Management and Fulfillment System
Maximum Marks	4 Marks

Solution Architecture:

Solution architecture bridges the gap between the network-service problem and the ServiceNow technology solution. For this project, the architecture defines how a network request moves from submission through validation, approval, notification, fulfillment and completion, while providing role-based access and monitoring.

- Provide a structured ServiceNow solution for network request submission and fulfillment.
- Define the components, roles, workflow behavior and interactions involved in the request lifecycle.
- Automate validation, approval routing, notifications and fulfillment task creation.
- Provide specifications for controlled access, status tracking, task ownership and SLA monitoring.

Solution Architecture Diagram:

Network Request Management & Fulfillment — Architecture and Data Flow

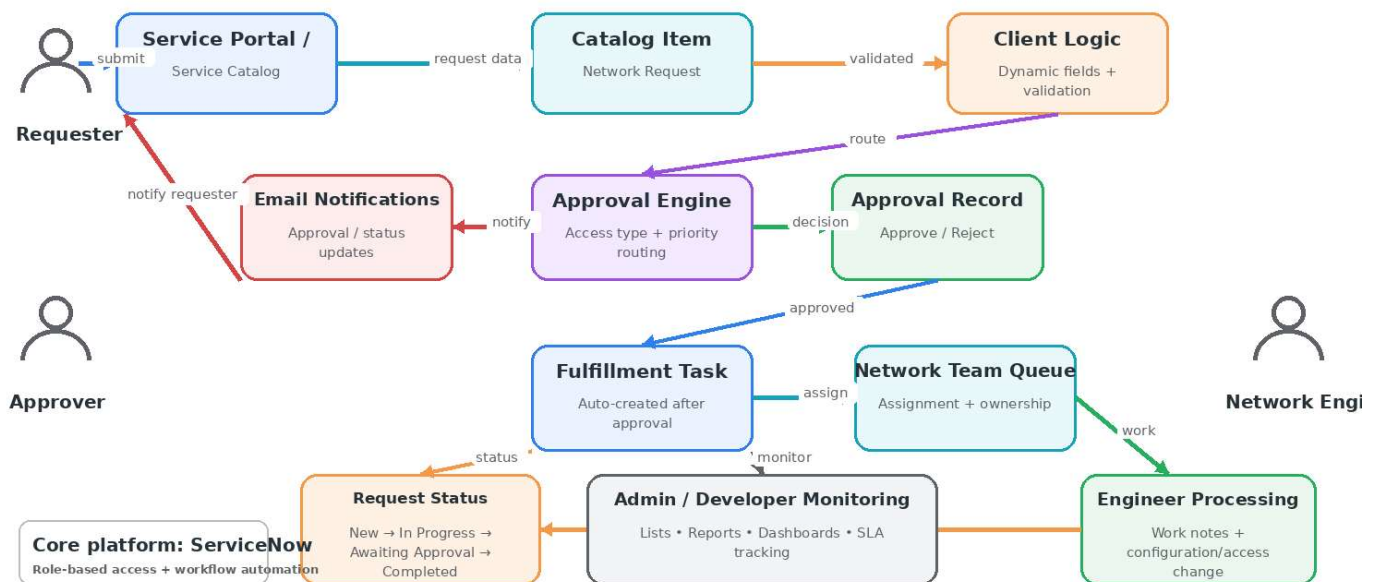

Figure 1: Architecture and data flow of the Network Request Management and Fulfillment System

Key Components:

Component	Purpose
Service Portal / Service Catalog	Entry point for requesters to submit network requests.
Network Request Catalog Item	Captures request type, access level, device and business justification.
Client-side Logic	Dynamically displays relevant fields and validates request data.
Approval Engine	Routes requests based on network access type and priority.
Notifications	Sends approval and lifecycle notifications to approvers and requesters.
Fulfillment Task / Network Team	Creates and assigns network tasks after approval.
Monitoring	Lists, reports, dashboards and SLA tracking for administrators and developers.
