

Acceptance Testing

UAT Execution & Report Submission

Date	17 September 2026
Team ID	Individual project
Project Name	Automated Network Request Management in ServiceNow
Maximum Marks	4 Marks

1. Purpose of Document

The purpose of this document is to explain the UAT test coverage and open issues of the Automated Network Request Management in ServiceNow project. Testing covers the complete Network Request lifecycle: request submission, RITM creation, catalog-variable retrieval, Database Tables record creation, approval, approval-based decision logic, email notification, approved/rejected record updates, and Flow Designer execution monitoring.

2. Defect Analysis

During the UAT review of the implemented workflow, no known defects were recorded for the core request-to-approval-to-record-update flow. Since no defects were recorded, all severity counts are zero.

3. Test Case Analysis

This section summarizes the UAT test cases for the main functional areas of the Automated Network Request Management workflow, including Service Catalog submission, Database Tables record creation, approval processing, notifications, and workflow execution.

Section	Total Cases	Not Tested	Fail	Pass
Service Catalog Request	3	0	0	3
Requested Item / RITM	2	0	0	2
Database Tables Record	2	0	0	2
Approval Request	3	0	0	3
Approval Decision Logic	2	0	0	2
Email Notifications	2	0	0	2
Workflow Execution	2	0	0	2
Total	16	0	0	16

4. UAT Test Scenarios

ID	Test Scenario	Test Action	Expected Result
TC-01	Submit Network Request	User submits the Network Request catalog item.	Request and RITM are created successfully.
TC-02	Start Network Request Flow	A new Network Request is submitted.	Network Request Flow starts for the requested item.
TC-03	Retrieve Catalog Variables	Flow reaches Get Catalog Variables.	Configured catalog variables are retrieved.
TC-04	Create Database Record	Flow reaches Create Database Tables Record.	A Database Tables record is automatically created.
TC-05	Generate Request Email	Flow reaches Send Email.	Request-created email record is generated.
TC-06	Generate Approval	Flow reaches Ask For Approval.	Approval Request is created for the configured approver.
TC-07	Approve Request	Approver selects Approve.	Approval State becomes Approved and IF evaluates True.
TC-08	Process Approved Request	Approved branch executes.	Approval Status becomes Approved and Assignment to becomes ITIL User.
TC-09	Reject Request	Approver selects Reject.	IF evaluates False and ELSE branch executes.
TC-10	Process Rejected Request	Rejected branch executes.	Approval Status becomes Rejected.

TC-11	Dynamic Catalog UI	User selects Existing as Type of Connection.	Existing ID is displayed; it is hidden for New.
TC-12	Review Flow Execution	Administrator opens Flow Designer execution details.	Execution states show completed, waiting, or skipped actions as applicable.
TC-13	Review Email Logs	Administrator opens System Logs → Emails.	Generated request and approval email records are visible.

5. Open Issues / UAT Observations

No blocking issue was identified in the core workflow design. The main UAT observation is that the Network Request catalog item must be correctly associated with the Network Request Flow Designer flow. If the flow is not linked to the catalog item, submitting the request will not start the intended automation.

For UAT, the approval and rejection paths should be tested separately. One request should be approved to verify Approval Status becomes Approved and Assignment to becomes ITIL User. Another request should be rejected to verify Approval Status becomes Rejected. Workflow Studio execution details and the Emails list can be used to verify the processing.

6. UAT Completion Summary

The acceptance testing scope covers Network Request submission, RITM creation, catalog-variable retrieval, Database Tables record creation, email notification, Approval Request creation, approval decision logic, approved/rejected updates, assignment for approved requests, dynamic catalog UI behavior, and workflow execution monitoring. The intended result is a consistent automated process in which approved requests are updated as Approved and rejected requests are updated as Rejected.

UAT Evidence: The approval scenario was successfully verified using an actual Network Request record where the Approval Request state became Approved, Approval Status became Approved, and Assignment to became ITIL User. Email records were also verified in ServiceNow.
