

PROJECT REPORT

AUTOMATED NETWORK REQUEST MANAGEMENT

Field	Details
Team Member	J. Sravani
Platform	ServiceNow
Project Date	16 September 2026

1. INTRODUCTION

1.1 Project Overview

Automated Network Request Management in ServiceNow is an individual ServiceNow project that standardizes the lifecycle of network-related service requests. The solution provides a Network Request catalog item through the Service Portal/Service Catalog, captures the required request information, validates the submission, routes the request for approval, creates fulfillment tasks after approval, and supports status tracking and notifications.

The project documentation identifies the key stakeholders as requesters, approvers and network engineers. The overall goal is to replace fragmented manual coordination with a centralized and traceable ServiceNow workflow.

1.2 Purpose

- Provide a simple and standardized method for submitting network-related requests.
- Capture complete request information before processing.
- Automate approval routing according to access type and priority.
- Automatically create and assign fulfillment tasks after approval.
- Provide clear request ownership, status visibility and notifications.
- Support controlled access, reporting and SLA monitoring.

The project context and business objectives in the ideation material specifically identify manual effort, approval bottlenecks, incomplete information and limited visibility as the main operational concerns.

2. IDEATION PHASE

2.1 Problem Statement

Network-related service requests may be handled through manual communication, email, spreadsheets or inconsistent processes. This can lead to incomplete information, repeated follow-up, approval delays and difficulty tracking fulfillment. The documented project problem statement asks how the complete network-request lifecycle can be streamlined and automated in ServiceNow so that users can submit standardized requests, requests can be validated and routed for approval, network teams can fulfill them efficiently, and stakeholders can track status and SLA performance centrally.

Two stakeholder-focused problem statements were defined. PS-1 focuses on a requester who needs a simple, standardized way to submit and track a network request. PS-2 focuses on an approver or network engineer who needs complete information, automated routing and controlled fulfillment.

Problem Statement PS-1: Network Requester

Problem Statement (PS)	I am	I'm trying to	But	Because	Which makes me feel
PS-1	An employee or authorized network requester	Request network access, VPN access, firewall changes or other network services quickly and correctly	The existing request process can be manual, unclear and inconsistent, requiring repeated communication and follow-up	There may be no standardized request form, complete validation or clear visibility into the request lifecycle	Frustrated and uncertain about when the request will be completed

2.2 Empathy Map Canvas

The empathy analysis identifies two main personas: the Network Requester and the Network Engineer/Approver. Requesters value simplicity, transparency and timely status updates, while engineers and approvers need complete information, workload visibility, automated routing and controlled access. The documented pain points include confusing processes, repeated requests for missing information, delayed approvals, manual task assignment and SLA risk.

Empathy Map Canvas

Automated Network Request Management in ServiceNow

Primary Persona: Network Requester		
An employee or authorized user who needs network access, VPN access, a firewall change, a network configuration change or assistance with a network-related service.		
Think & Feel • Wants the request to be simple and quick. • Worries about delays affecting work. • Needs confidence that sensitive access is handled securely. • Wants clear information about request progress.	 NETWORK REQUESTER Needs a fast, standardized and transparent way to request network services.	Hear • Instructions from managers and IT teams. • Feedback that approvals may take time. • Security and compliance requirements. • Updates from colleagues about similar requests.
Say & Do • Selects the required network request type. • Provides device details and business justification. • Submits the request through the Service Catalog. • Checks status and follows up when needed.		See • Different network services with different requirements. • Request forms and approval stages. • Status updates such as New or In Progress. • Notifications about approval or completion.
Pain • Manual or confusing request processes. • Repeated requests for missing information. • Delayed approvals and fulfilment. • Limited visibility into request status. • Uncertainty about when access will be provided.	Gain • Easy-to-use standardized request form. • Relevant fields displayed dynamically. • Faster routing and fulfilment. • Real-time status visibility. • Notifications at important stages.	

Secondary Persona: Network Engineer / Approver		
A member of the Network Team or an authorized approver responsible for reviewing requests, making approval decisions, processing fulfilment tasks and maintaining network security and compliance.		
Think & Feel • Wants complete and accurate request information. • Needs to maintain security and compliance. • Wants to avoid repetitive manual work. • Needs visibility into workload and priorities.	 NETWORK ENGINEER / APPROVER Needs an efficient, secure and well-organized workflow for approval and fulfilment.	Hear • Urgent requests from business users. • Security policies and management requirements. • Escalations related to delayed requests. • Notifications requiring approval or action.
Say & Do • Reviews request details and justification. • Approves or rejects eligible requests. • Updates task states and work notes. • Completes network configuration or access changes.		See • Requests with different access levels and priorities. • Pending approvals and assigned tasks. • SLA deadlines and workload queues. • Reports showing task performance.
Pain • Incomplete or inconsistent requests. • Manual approval routing and task assignment. • Difficulty tracking work across requests. • Repeated follow-up communication. • Risk of missing SLA targets.		Gain • Standardized request information. • Automated approval and task workflows. • Clear task ownership and priorities. • Work notes and status tracking. • Reports and dashboards for monitoring.

Figure 1: Existing Empathy Map Canvas – Network Engineer / Approver

2.3 Brainstorming

The brainstorming activity grouped the solution ideas into request capture, user experience, validation, approval automation, notifications, fulfilment, task processing, status tracking, security and access, and reporting/SLA. The prioritization criteria were importance and feasibility within a ServiceNow PDI.

Idea Group	Brainstormed Ideas
Request Capture	Create a Network Request catalog item; capture request type, access level, device details, priority and business justification.
User Experience	Use Catalog Client Scripts to dynamically show or hide fields based on the selected network request type.
Validation	Validate mandatory information, business justification and request-specific details before submission.
Approval Automation	Route requests for approval based on network access type and priority; support approval and rejection decisions.
Notifications	Send automated email notifications to approvers and requesters at key lifecycle stages.
Fulfilment	Automatically create network fulfilment tasks after approval and assign them to the appropriate Network Team.
Task Processing	Allow network engineers to update task states, add work notes and complete configuration or access changes.
Status Tracking	Automatically update the request lifecycle: New → Awaiting Approval → In Progress → Completed.
Security & Access	Configure Network Team, Approvers and Requesters groups with appropriate roles and access controls.
Reporting & SLA	Track requests, approvals, task performance and SLA compliance through lists, reports and dashboards.

Functional Grouping

- **Core Request Management:** Catalog item, request variables and validation.
- **Workflow Automation:** Approval routing, task creation, assignment and status updates.
- **User & Access Management:** Requesters, Approvers, Network Team groups, roles and ACLs.
- **Communication:** Automated notifications for approval, rejection, progress and completion.
- **Monitoring & Governance:** Lists, reports, dashboards and SLA compliance.

Step 3: Idea Prioritization

Ideas are prioritized using two criteria: **Importance** (business value and necessity) and **Feasibility** (practicality of implementation in a ServiceNow PDI).

Figure 2: Existing Brainstorming and Idea Grouping Artifact

3. REQUIREMENT ANALYSIS

3.1 Customer Journey Map

The customer journey below is derived from the documented request lifecycle and stakeholder needs. It maps the user's experience from the point at which a network need arises to request completion.

Stage	User Action	System / Team Response	User Need / Expected Outcome
1. Need	Employee identifies a network access or configuration need.	Request process is available through ServiceNow.	Clear entry point.
2. Submission	Requester opens the Network Request catalog item and enters details.	Catalog variables capture the required information.	Simple, complete form.
3. Validation	Requester submits the form.	Dynamic fields and validation help ensure relevant information is present.	Correct submission.
4. Approval	Request is routed according to access type and priority.	Approver receives the approval notification and decides approve/reject.	Transparent decision stage.
5. Fulfillment	Approved request becomes a fulfillment task.	Task is assigned to the appropriate Network Team.	Clear ownership.
6. Processing	Network engineer updates work notes and performs the change.	Task state and request status are updated.	Visible progress.
7. Completion	Request reaches completion.	Requester receives lifecycle notification; records remain available for reporting/SLA monitoring.	Closure and traceability.

3.2 Solution Requirement

The documented functional requirements cover request submission, requester information, dynamic form behavior, automated request processing, approval management, approval-based updates, email notifications, request tracking and security. Non-functional requirements cover usability, security, reliability, performance, availability and scalability.

Req.	Requirement
FR-1	Submit Network Request through Service Portal / Service Catalog and capture request information.
FR-2	Auto-populate requester information from the selected user.
FR-3	Display or hide request-specific fields based on the selected connection/request type.
FR-4	Trigger the Network Request flow, retrieve variables and create the required record.
FR-5	Create approval records and allow configured approvers to approve or reject.
FR-6	Update approval status and assignment based on the decision.
FR-7	Send request and approval-related email notifications.
FR-8	Provide request tracking and ACL-based security.

3.3 Data Flow Diagram

The DFD describes how request information moves from the requester into the Network Request catalog, through Flow Designer, into ServiceNow records and approval processing, and then into notification and fulfillment activities.

Data Flow Diagrams:

A Data Flow Diagram (DFD) is a visual representation of how information moves through a system. For the Automated Network Request Management in ServiceNow project, the DFD shows how a requester submits a Network Request, how ServiceNow processes the catalog variables through Flow Designer, where the request data is stored, and how approval decisions update the request.

Example: [\(Simplified\)](#)

Example: DFD Level 0 (Industry Standard)

Figure 4: Existing Data Flow Diagram artifact

3.4 Technology Stack

The project is implemented natively on the ServiceNow cloud platform. The documented architecture identifies Service Portal/Service Catalog as the user interface, Catalog Items and Variable Sets for request capture, Catalog UI Policy for dynamic behavior, Flow Designer/Workflow Studio for automation, a ServiceNow custom table for stored request information, ServiceNow platform storage, email/SMTp infrastructure for notifications, and the ServiceNow Cloud Platform as the execution environment.

Component	Technology / Service	Purpose
User Interface	ServiceNow Service Portal / Service Catalog	Submit and track Network Requests.
Request Capture	Catalog Item + Variable Set	Collect requester and network request information.
Dynamic Form	Catalog UI Policy / client-side logic	Show relevant fields based on request selection.
Automation	ServiceNow Flow Designer / Workflow Studio	Retrieve variables, create records, notify and process approvals.
Data Storage	ServiceNow custom table / Platform Database	Store request and approval-related records.
Notifications	ServiceNow Email / SMTP	Deliver lifecycle and approval notifications.
Infrastructure	ServiceNow Cloud Platform	Host and execute the application.

Technical Architecture:

The technical architecture below represents the implemented ServiceNow solution and the technologies/components used to automate Network Request processing.

Architecture: Automated Network Request Management in ServiceNow

Reference: ServiceNow platform and Flow Designer architecture

Guidelines:

- Include all the processes (As an application logic / Technology Block)
- Provide infrastructural demarcation (Local / Cloud)
- Indicate external interfaces (third party API's etc.)
- Indicate Data Storage components / services
- Indicate interface to machine learning models (if applicable)

Figure 5: Existing Technical Architecture / Technology Stack artifact

4. PROJECT DESIGN

4.1 Problem–Solution Fit

The Problem–Solution Fit connects the identified customer segments, jobs-to-be-done, triggers, constraints, behaviors and root cause with the proposed ServiceNow solution. The customer segments are requesters, approvers, network engineers, administrators and developers. The documented root cause is the difficulty of managing request information, approval routing, fulfillment ownership, status updates and requester communication through one structured process.

Network Request Management and Fulfillment System

1. CUSTOMER SEGMENT(S) CS - Requesters who need network access or device/network changes. - Approvers responsible for authorizing access. - Network Team/engineers who fulfill approved requests. - Administrators and Developers who manage the platform and controls.	6. CUSTOMER CONSTRAINTS CC - Request details must be complete and accurate. - Different access types require different approval paths. - Network teams need clear ownership and actionable tasks. - Requesters need visibility without repeatedly following up.	5. AVAILABLE SOLUTIONS AS - Service Catalog/Service Portal for standardized request submission. - Client-side logic for dynamic fields and validation. - Approval workflows and automated notifications. - Fulfillment tasks, assignment, status tracking, reports and dashboards.
2. JOBS-TO-BE-DONE / PROBLEMS J2P - Submit a network request with all required information. - Select request type, access level and device details. - Provide a business justification. - Obtain the required approval and complete the network change efficiently. - Track progress until completion.	9. PROBLEM ROOT CAUSE RC The request lifecycle can become difficult to manage when request information, approval routing, fulfillment ownership, status updates and requester communication are not handled through one structured process. The project addresses this by standardizing the request and automating the major lifecycle steps.	7. BEHAVIOR BE Requesters submit through the Service Catalog/Service Portal and provide the required details. The system validates the data, routes approval according to access type and priority, sends notifications, creates fulfillment tasks after approval, and updates the request as work progresses.
3. TRIGGERS TR - Employee needs network access or a network-related change. - A device requires network configuration/access. - A business task requires a new or modified network permission. - A request reaches an approval or fulfillment stage. 4. EMOTIONS: BEFORE / AFTER EM Before: uncertainty about the correct request details, approval status, ownership, and completion time. After: clearer submission, transparent status, timely notifications, defined ownership, and a structured completion process.	10. YOUR SOLUTION SL A ServiceNow-based Network Request Management and Fulfillment System. It provides a structured Network Request catalog item with dynamic fields and validation; routes requests for approval based on network access type and priority; sends automated notifications; creates and assigns network fulfillment tasks after approval; supports engineer work notes and task completion; automatically updates request status; and provides tracking through lists, reports, dashboards and SLA monitoring.	8. CHANNELS OF BEHAVIOUR CH Online: - Service Portal / Service Catalog - ServiceNow request, approval and task records - Automated email notifications Operational: - Lists, reports and dashboards for administrators and developers - Work notes and task updates for network engineers

Figure 6: Existing Problem–Solution Fit Canvas

4.2 Proposed Solution

The proposed solution is a ServiceNow-based Network Request Management and Fulfillment System. A Network Request catalog item captures request details; dynamic fields and validation improve request quality; approval is routed according to access type and priority; notifications keep stakeholders informed; approved requests create fulfillment tasks; engineers process those tasks using work notes; and request status is tracked through completion.

The documented solution also identifies social/customer value through clearer submission, automated approval communication, defined task ownership and improved visibility. It is primarily an internal enterprise service-management solution, with business value coming from operational efficiency, standardized processing and SLA monitoring.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Network-related requests can involve different request types, access levels, devices, business justifications, approval requirements and fulfillment activities. Without a structured lifecycle, requests may require repeated communication, manual routing and follow-up, making it difficult to maintain clear ownership and visibility. The project addresses the need for a standardized and trackable network request process.
2.	Idea / Solution description	Develop a ServiceNow-based Network Request Management and Fulfillment System using the Service Catalog/Service Portal. A Network Request catalog item captures request type, access level, device details and business justification. Client-side logic dynamically displays relevant fields and validates request information. The system routes requests for approval based on network access type and priority, sends automated email notifications, and, after approval, creates and assigns network fulfillment tasks to the appropriate Network Team. Engineers update work notes and complete the task, while request status progresses through New, In Progress, Awaiting Approval and Completed stages. Administrators and Developers can monitor requests, approvals, task performance and SLA compliance using lists, reports and dashboards.
3.	Novelty / Uniqueness	The solution combines request capture, dynamic field behavior, validation, conditional approval routing, automated notifications, fulfillment task creation and lifecycle tracking into one ServiceNow workflow. Instead of treating submission, approval and fulfillment as separate activities, the proposed system connects them through a standardized end-to-end process. Role-based access for Requesters, Approvers and the Network Team also supports controlled participation in the workflow.
4.	Social Impact / Customer Satisfaction	The solution improves the requester experience by providing a clear method to submit network requests and receive notifications at important stages. Approvers receive structured requests and automated approval notifications, while network engineers receive assigned fulfillment tasks with relevant information. Improved visibility, ownership and status tracking can reduce unnecessary follow-ups and provide a more transparent service experience for employees.
5.	Business Model (Revenue Model)	This project is designed primarily as an internal enterprise service-management solution rather than a direct consumer revenue product. Its business value comes from improving operational efficiency, reducing manual coordination, standardizing network request handling and supporting SLA monitoring. In an enterprise deployment, the solution can form part of a ServiceNow implementation or managed service offering, with value measured through process efficiency, service quality and reduced administrative effort.

Figure 7: Existing Proposed Solution artifact

4.3 Solution Architecture

The solution architecture defines how a request moves from submission through validation, approval, notification, fulfillment and completion, while maintaining role-based access, status tracking, task ownership and SLA monitoring.

```

graph TD
    Requester[Requester] -- submit --> ServicePortal[Service Portal / Service Catalog]
    ServicePortal -- request data --> CatalogItem[Catalog Item  
Network Request]
    CatalogItem -- validated --> ClientLogic[Client Logic  
Dynamic fields + validation]
    ClientLogic -- route --> ApprovalEngine[Approval Engine  
Access type + priority routing]
    ApprovalEngine -- decision --> ApprovalRecord[Approval Record  
Approve / Reject]
    ApprovalRecord -- approved --> FulfillmentTask[Fulfillment Task  
Auto-created after approval]
    FulfillmentTask -- assign --> NetworkTeamQueue[Network Team Queue  
Assignment + ownership]
    NetworkTeamQueue -- work --> EngineerProcessing[Engineer Processing  
Work notes + configuration/access change]
    EngineerProcessing --> AdminMonitoring[Admin / Developer Monitoring  
Lists • Reports • Dashboards • SLA tracking]
    AdminMonitoring -- status --> RequestStatus[Request Status  
New → In Progress → Awaiting Approval → Completed]
    RequestStatus -- notify requester --> ServicePortal
    ServiceNow[Core platform: ServiceNow  
Role-based access + workflow automation]
  
```

Key components include the Service Portal/Service Catalog, Network Request Catalog Item, client-side logic, approval engine, notifications, fulfillment task/network team and monitoring through lists, reports, dashboards and SLA tracking.

5.1 Project Planning

Phase	Major Activities	Deliverable / Outcome
1. Ideation	Problem identification, empathy mapping, brainstorming and prioritization.	Problem definition and prioritized feature set.
2. Requirement Analysis	Customer journey, functional/non-functional requirements, DFD and technology selection.	Requirement baseline and technical direction.
3. Project Design	Problem–solution fit, proposed solution and solution architecture.	Solution design and architecture.
4. ServiceNow Configuration	Catalog item, variables, dynamic behavior, groups/roles/ACLs and workflow automation.	Configured ServiceNow application.

Phase	Major Activities	Deliverable / Outcome
5. Approval & Fulfillment	Approval routing, notifications, fulfillment task creation, assignment and engineer processing.	End-to-end request lifecycle.
6. Testing	Functional workflow verification, notifications, status transitions and monitoring.	Validated workflow.
7. Documentation	Final report, screenshots, demo/video and supporting documentation.	Submission-ready project report.

5.2 Request Lifecycle

1. New – request is submitted and recorded.
2. Awaiting Approval – request is routed to the configured approver.
3. In Progress – approved work is assigned and processed by the Network Team.
4. Completed – the fulfillment work is completed and the request lifecycle is closed.

The project artifacts also describe automatic task creation after approval, work notes during engineer processing and notifications at key lifecycle stages.

6. FUNCTIONAL AND PERFORMANCE TESTING

6.1 Functional Testing

Functional testing verifies that the configured ServiceNow components behave according to the documented functional requirements. The following test cases are derived from the project flow and requirements.

Test ID	Test Scenario	Expected Result
FT-01	Open Network Request catalog item.	Catalog item opens and required fields are available.
FT-02	Select a request/connection type.	Relevant dynamic fields are displayed or hidden as configured.
FT-03	Submit complete request.	Request is created successfully.
FT-04	Submit incomplete/invalid request.	Configured validation prevents or flags invalid submission.
FT-05	Trigger automated flow.	Submitted variables are retrieved and processing begins.
FT-06	Approval required.	Approval record is created and routed to the configured approver.

Test ID	Test Scenario	Expected Result
FT-07	Approve request.	Approval state becomes Approved and fulfillment processing continues.
FT-08	Reject request.	Approval state becomes Rejected and the configured rejection path executes.
FT-09	Approved fulfillment.	Network fulfillment task is created and assigned.
FT-10	Engineer updates task.	Work notes and task state are stored correctly.
FT-11	Complete fulfillment.	Request/task reaches the configured completed state.
FT-12	Requester notification.	Notification is generated at configured lifecycle stages.
FT-13	Administrator monitoring.	Request, approval and task information is visible in lists/reports/dashboards.

6.2 Performance Testing

The supplied project artifacts define performance as a non-functional requirement: catalog submission and automated processing should complete without unnecessary manual steps, and the Flow Designer process should support additional network request records and future workflow extensions.

Performance Check	What to Observe	Result Entry
Catalog submission	Form submission completes without unnecessary manual steps.	Record actual observed result from ServiceNow instance.
Flow execution	Variables are retrieved and downstream actions execute in the configured sequence.	Record actual observed result.
Approval routing	Approval is generated and notification is sent after the configured trigger.	Record actual observed result.
Task creation	Fulfillment task is created and assigned after approval.	Record actual observed result.
Status propagation	Request/task states update as configured.	Record actual observed result.

Performance Check	What to Observe	Result Entry
Scalability check	Multiple requests can be processed using the same catalog/flow pattern.	Record actual observed result.

No numerical response-time, throughput or SLA measurements were supplied in the uploaded project artifacts. Therefore, this report does not invent performance figures; the actual values can be added after execution in the final ServiceNow instance.

7. RESULTS

7.1 Output Screenshots

The final report should contain screenshots from the actual ServiceNow instance. The FSD documentation specifically identifies screenshots for the Network Request catalog item, dynamic fields, approval, fulfillment task, request lifecycle and reports/SLA monitoring. The placeholders below are intentionally kept so the final screenshots can be inserted without changing the report structure.

The screenshot displays the ServiceNow user administration page for 'User - Abraham Lincoln'. The interface includes a top navigation bar with 'servicenow' logo and tabs for 'All', 'Favorites', 'History', 'Workspaces', and 'Admin'. A search bar and user profile icon are also present. The main content area is divided into two columns. The left column contains fields for 'User ID' (abraham.lincoln), 'First name' (Abraham), 'Last name' (Lincoln), 'Title' (empty), and 'Department' (empty with a search icon). Below these are checkboxes for 'Password needs reset', 'Locked out', and 'Active' (checked), and a dropdown for 'Identity type'. The right column contains fields for 'Email' (abraham.lincoln@example.com), 'Language' (None), 'Calendar integration' (Outlook), 'Time zone' (System (America/Los Angeles)), 'Date format' (System (2026-08-19)), 'Business phone' (empty), 'Mobile phone' ((555) 555-0004), and a 'Photo' link to add a picture. At the bottom, there are buttons for 'Update', 'Set Password', and 'Delete'. Below these are 'Related Links' for 'View linked accounts', 'View Subscriptions', and 'Reset a password'. A section for 'Roles (4)' is visible, with tabs for 'Roles (4)', 'Groups (2)', 'Delegates', and 'User Client Certificates'. A table header for 'Role' is shown, with columns for 'State', 'Inherited', and 'Inheritance Count'.

8. ADVANTAGES & DISADVANTAGES

8.1 Advantages

- Standardized network request submission through the Service Catalog.
- Reduced manual coordination through automated approval and fulfillment steps.
- Dynamic fields and validation improve request completeness.
- Clear role separation for Requesters, Approvers and Network Team members.
- Automated notifications improve communication and visibility.
- Automatic task creation provides clear ownership after approval.
- Work notes and status tracking improve traceability.
- Reports, dashboards and SLA monitoring support operational governance.
- ServiceNow cloud execution avoids the need for a separate application hosting stack.

8.2 Disadvantages / Limitations

- The solution depends on the availability and configuration of the ServiceNow platform.
- Workflow behavior must be maintained when request types, approval rules or organizational responsibilities change.
- External network configuration is not performed by the ServiceNow workflow itself unless a separate integration is configured.
- Performance results depend on the ServiceNow instance configuration and actual execution conditions.
- The current project scope does not include a custom REST API or external database.

9. CONCLUSION

The Automated Network Request Management in ServiceNow project addresses the documented need for a centralized and standardized lifecycle for network-related service requests. The solution connects request capture, dynamic field behavior, validation, approval routing, notifications, fulfillment task creation, engineer processing, status tracking and monitoring in one ServiceNow workflow.

The project artifacts show a consistent progression from user problems and empathy insights to requirements, data flow, technology selection, problem–solution fit and solution architecture. The resulting design provides Requesters with a structured submission channel, Approvers with controlled decision points, Network Engineers with actionable fulfillment tasks, and Administrators/Developers with visibility into requests, approvals, tasks and SLA-related information.

10. FUTURE SCOPE

- Add additional network request types and reusable request templates.
- Introduce more detailed approval matrices based on department, risk, access type and priority.
- Add automated reminders and escalations for pending approvals and overdue fulfillment tasks.
- Expand SLA dashboards and management-level analytics.
- Integrate with identity, network-management or configuration systems where required.
- Add knowledge articles and contextual guidance to improve request quality.
- Extend the same ServiceNow design pattern to hardware, software, access and other IT service requests.
- Add richer audit and compliance reporting for sensitive network-access changes.

The uploaded proposed-solution artifact explicitly identifies scalability through additional request types, departments, approval levels, teams, service-level requirements, workflows and reports.

11. APPENDIX
